

ENHANCE FOUNDING STATEMENT

"We examine what the structure shows."

ENHANCE was developed to examine why systems created to address climate risk can produce outcomes different from those they declare.

Finance and technology are necessary to protect climate systems. They are not sufficient unless the projects they support are causally credible, financially aligned, and capable of producing verifiable outcomes.

A project may be well intentioned and still be structurally unable to achieve what it promises. A financial instrument may mobilize capital and still be mismatched with the country, beneficiary, or risk it is meant to serve.

ENHANCE was built to examine these gaps.

At the intersection of risk, finance, engineering, and climate, ENHANCE has developed analytical frameworks including ToC:f(x)[™], VERA[™], C-FAIR[™], VORTA[™], and related models. These frameworks examine causal integrity, financial alignment, country suitability, beneficiary reach, value realization, and the credibility of climate claims. Methods and applications have been documented through public working papers, research reports, and case assessments.

ENHANCE does not claim that its methods are complete or infallible.

Methods improve through evidence, challenge, correction, and repeated application. We welcome substantive responses, better data, alternative explanations, and stronger methods.

Our independence is based on transparent rules.

ENHANCE discloses material funding relationships and conflicts relevant to each assessment and does not accept analytical control from an assessed party, sponsor, or client.

We examine structures.

We trace claims to evidence.

We document what the evidence can and cannot support.
